

Catalog 2BE series

**water ring vacuum pumps
and compressors**

2BE series water ring vacuum pumps and compressors

Usage and characteristics

2BEA series water ring vacuum pumps and compressors, which is a series of high efficiency and energy saving products, is developed on the basis of our company's years of work experience and achievements in scientific research, combining the advanced international experience of similar products. It's used to pump insoluble in water non-corrosive air without solid particles to form pressure or vacuum in a confined space. By changing materials and structure, it can also be used to pump corrosive air or use a corrosive liquid as the working fluid. It's widely used in paper production, chemical industry, light industry, petrifaction, pharmaceuticals, food production, building material, electrical equipment, coal washing, ore dressing, fertilizer and many other areas. Particularly, in the coal industry, this type can pump highly flammable and explosive gas like methane, so it can be designed to install a ground gas pumping station, or match a mobile gas drainage system.

This series uses a single-stage, single-series structure, with advantages like reliable operation, simple structure, simple repair, high efficiency and energy saving. It will adapt to large drainage volume and shock waves and other poor conditions.

We conducted a systematic optimization design for the key components, such as the distribution board, impeller and pump spindle. A simpler structure leads to energy saving and higher efficiency. We choose welded impellers using once stamping to form. Molded lines are reasonable. Hubs are all processed, solving the dynamic balance problem fundamentally. Impellers and pump spindles use heating interference coordination, steady and reliable. After welding, impellers undergo heat treatment well, bringing impellers good toughness, so they are anti-bending and shocking, can adapt to many poor conditions.

2BEA series equips the gas-water separator, has suction and exhaust in multiple positions, and an exhaust valve repair window on the pump cover. The gap between the impeller and the distributing plate is adjusted by glands on both ends of the location bearing. It's very easy to install, operate and repair.

Our company's pumps are all after testing center's strict testing, superior performance and safe working.

1. Impeller
2. Wheel boss
3. Pump body
4. Air cavity
5. Suction hole
6. liquid(water)
7. Flexible vent

Decomposition structure diagram

The impeller, the only rotating component installed eccentrically with the pump body, rotates to form a liquid ring in the elliptical pump body. The working fluid acts as a sealing medium, compressing medium and cooling medium at the same time.

Continuous injection of working fluid is used to compensate for the liquid taken away by the exhausted gas.

In the suction stage, the liquid ring is gradually away from the hub, and the pumping medium is sucked from the suction port along the axis.

During the exhaust phase, the liquid ring gradually approaches the hub and discharges the pumping medium from the outlet along the axis.

Because the impeller is eccentric relative to the rotating liquid ring, the liquid reciprocates in the space between the blades, just as the piston moves in the cylinder - sucking and compressing the pumping medium.

2BEA series water ring vacuum pumps and compressors

2BE series water ring vacuum pumps and compressors

2BEA series products have the characteristics of strong suction capacity under relatively high vacuum. They are usually used to suck and compress gases without solid particles, insoluble in water and non-corrosive. They are ideal for papermaking, chemical industry, pharmaceuticals, petroleum, light industry, food, metallurgy, building materials, electrical appliances, coal washing, mineral processing, chemical fertilizer and other industries vacuum acquisition equipment.

2BEA Series Main Technical Parameters

Model	Absolute pressure (hPa)	Speed (r.p.m)	Power (kw)	Pumping speed (m3/min)								Weight (kg)
				Pressure 60hpa		Pressure 100hpa		Pressure 200hpa		Pressure 400hpa		
				Air	Saturated air	Air	Saturated air	Air	Saturated air	Air	Saturated air

1. The data is listed in the table in the condition that air temperature of 20°C, the water temperature of 15°C, exhaust pressure 1013 hpa, suction medium for saturated air.

2. The pump performance tolerances $\pm 10\%$

3. The motor power which is equipped with power, users have special requirement, please explain it when ordering.

4. Some pumps, such as 2BEA-355-1 can be refit to the structure that pump body is with partition board, not changing installation size, but can work under different inhalation absolute pressure on both sides of the pump body.

2BEC series water ring vacuum pumps and compressors

2BEC series products have been fully considered in the design that it must be able to extract a variety of gases. It has been widely used in papermaking, coal mine, power plant, vacuum filtration, chemical industry, petrochemical, food processing and other industries.

2BEC Series Main Technical Parameters
